

RESULT: HIGH CLOT RISK (99.1% confidence)

Patient Clinical Details

Age:	50 years
Sex:	Male
Resting Blood Pressure:	120 mm Hg
Cholesterol:	200 mg/dl
Max Heart Rate:	150 bpm
Fasting Blood Sugar >120:	No
Chest Pain Type:	Typical Angina
Exercise Induced Angina:	No
ST Depression:	1.0
ST Slope:	Upsloping
Major Vessels (0-3):	0
Thalassemia:	Normal

Risk Assessment Summary

AI Risk Classification:	HIGH RISK
Model Confidence:	99.1%
Model Used:	XGBoost Classifier

Interpretation: The AI model has identified significant risk factors associated with blood clot formation. Immediate consultation with a qualified physician is strongly recommended.

AI Explanation - Key Risk Factors (SHAP)

The chart below shows which patient features most influenced the AI prediction. Positive values increase risk while negative values reduce risk.

Blood Clot Risk Assessment Report

Recommendations

1. Schedule an appointment with a physician.
2. Consider D-Dimer testing if medically advised.
3. Avoid prolonged inactivity.
4. Stay hydrated.
5. Review medications with your doctor.
